

CS157A: Introduction to Database Management Systems

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder
Transactions

Suneuy Kim

Terminology

- A transaction groups a set of operations that transform the database from one consistent state to another.

Assignment Project Exam Help

<https://powcoder.com>

- Transaction processing system
 - Systems with large databases and hundreds of concurrent users executing database transactions.

Add WeChat powcoder

Motivations

- Concurrency control: Serializability of concurrent access to database
 - A DBMS typically allows many different transactions to access the database. This may result in data inconsistency.
- Recovery Mechanisms: Recoverability from failures in DBMS
 - Media failure (e.g. faulty hard drive)
 - System failure (e.g. power outage)

Database Operation Details

- Read_item(X) reads a database item named X
 - Find the address of the disk block that contains X
 - Copy that disk block into a buffer
 - Copy X from the buffer to the program
- Write_item(X) writes a database item X into the database
 - Find the address of the disk block that contains X
 - Copy that disk block into a buffer in main memory
 - Copy item X into the correct location in buffer.
 - Store the updated block from the buffer back to disk.

Add WeChat powcoder

Transaction Pseudocode

Start TRANSACTION

Assignment Project Exam Help
database operations here !
<https://powcoder.com>

Add WeChat powcoder
IF no error THEN COMMIT
ELSE ROLLBACK

COMMIT vs ROLLBACK

- COMMIT – Successful end of a transaction
Changes made by database operations are installed permanently in the database.
- ROLLBACK – Abnormal end of a transaction
Any changes made by database operations are undone.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Transaction ACID properties

- Atomicity

Transactions are atomic (all or nothing).

- Consistency

Transaction transforms the DB from one valid state to another valid state.

Assignment Project Exam Help

<https://powcoder.com>

- Isolation

Add WeChat powcoder

Transactions are isolated from each other.

- Durability

Once a transaction commits, it remains so even in the event of system or media failures.

Atomicity

To transfer money from 123 to 456.

UPDATE Accounts

SET balance = balance - 100

WHERE acctNo = 123;

UPDATE Accounts

SET balance = balance + 100

WHERE acctNo = 456;

Atomicity requires that both of the steps, or neither, be completed: all or none

Consistency

Any data written to the database must be valid according to all defined rules, including but not limited to constraints and triggers, and any combination thereof.

Examples: **Assignment Project Exam Help**

- Columns only store values of a particular type (int columns store only integers, etc..)
- Primary keys and unique keys are unique
- Check constraints are satisfied
- Foreign key constraints are satisfied
- In an application that transfers funds from one account to another, the consistency property ensures that the total value of funds in both the accounts is the same at the start and end of each transaction.

Isolation

- Deals with behavior of a transaction with respect to other concurrent transactions.
- Ensures **serializability** of concurrent execution of transactions - Operations may be interleaved, but execution must be equivalent to *some* serial order of all transactions.
- Providing isolation is the main goal of concurrency control

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

No Isolation

```
SELECT @seat = min(seatNo)
FROM flights
WHERE fltNo = 123 AND
fltDate = DATE '2013-12-25'
AND seatStatus = 'available';
```

```
UPDATE Flights
SET seatStatus = 'occupied'
WHERE fltNo = 123 AND
fltDate = DATE '2013-12-25'
AND seatNO = @seat;
```

User 1 finds
seat(22A) empty

User 2 finds
seat empty

User 1 sets seat
22A occupied

User2 sets seat
22A occupied

time

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Isolation

```
Lock flights;  
SELECT @seat = min(seatNo)  
FROM flights  
WHERE fltNo = 123 AND  
fltDate = DATE '2013-12-25'  
AND seatStatus = 'available';  
  
UPDATE Flights  
SET seatStatus = 'occupied'  
WHERE fltNo = 123 AND  
fltDate = DATE '2013-12-25'  
AND seatNO = @seat;  
Unlock flight;
```

User 1 finds seat empty
and sets seat 22A occupied

User 2 finds
the seat 22A occupied

OR

User 2 finds seat empty
and sets seat 22A occupied

User 1 finds
the seat 22A occupied

Durability

- Guarantees that transactions that have committed will survive any subsequent malfunctions.
[Assignment Project Exam Help](https://powcoder.com)
- Example: If a flight booking reports that a seat has successfully been booked, then the seat will remain booked even if the system crashes.
<https://powcoder.com>
[Add WeChat powcoder](https://powcoder.com)

Durability

- Write-Ahead Transaction Log: First write changes to a transaction log and then write the changes to the database.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Durability

Media failure (e.g. a faulty disk drive)

- Data loss
- Databases are recovered by using backups and transaction logs.
- A DBA has to
 - Take backups regularly
 - Keep your transaction logs and your main database files on different hard disks
 - Backup the tail of the log (the log that has not been backed-up)

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Durability

System failures (e.g. system crashes, power outages)

- Half-performed transactions that were interrupted and not yet committed – roll back using the transaction log
- Committed transactions may not have their changes written to disk – if the conditions are right and there's enough info in the transaction log, replay them

Set up to study Concurrency Problem

Users

id	name	age
1	Joe	20
2	Jill	25

Assignment Project Exam Help

Suppose T1 is a reader and T2 is a writer.

<https://powcoder.com>

T1:

SELECT age FROM Users WHERE id = 1; // Q1

SELECT age FROM Users WHERE id = 1; // Q1 again

T2:

UPDATE User SET age = 21 WHERE id = 1; // Q2

Read Phenomena

- Dirty reads
- Non-repeatable reads
- Phantom reads

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Dirty Reads

- A dirty read occurs when a transaction is allowed to read data from a row that has been modified by another running transaction and not yet committed.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Dirty reads

T1

```
SELECT age FROM Users  
WHERE id = 1; // 20
```

T2

```
UPDATE User SET age = 21  
WHERE id = 1; // 21
```

```
SELECT age FROM Users  
WHERE id = 1; // 21
```

Rollback

A user with id = 1 and age = 21 does not exist !

Non-repeatable reads

- A non-repeatable read occurs, when during the course of a transaction, a row is retrieved twice and the values within the row differ between reads.
- Sometimes non-repeatable reads might be completely desirable. Some applications may want to know the absolute, real-time value, whereas other types of transactions might need to read the same value multiple times. → Set the isolation level according to the need of application.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Non-repeatable reads

T1

T2

```
SELECT age FROM Users  
WHERE id = 1; // 20
```

```
UPDATE User SET age = 21  
WHERE id = 1; // 21  
COMMIT;
```

```
SELECT age FROM Users  
WHERE id = 1; // 21
```

Transaction 1 has already seen a different value for *age* in that row !

Phantom reads

- A phantom read occurs when, in the course of a transaction, two identical queries are executed, and the collection of rows returned by the second query is different from the first.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Phantom reads

T1

```
SELECT age FROM Users  
WHERE age > 10 and age < 30;
```

T2

```
INSERT INTO Users  
VALUES (3, BOB', 27);  
Commit;
```

```
SELECT age FROM Users  
WHERE age > 10 and age < 30;
```

Transaction 1 gets a different set of rows for the second time.

Transaction Isolation Levels

- Controls the degree of locking that occurs when selecting data.
- Isolation Levels
 - Read uncommitted (the lowest)
 - Read committed
 - Repeatable reads
 - Serializable (the highest)

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Transaction Isolation Levels

- A higher isolation level lowers the risk of concurrency problems but also lowers the average performance due to locking overhead and loss of parallelism.
- With a relaxed isolation level application programmer must ensure not to cause any software bugs

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Locks

- Read locks
 - There can be several read locks on a resource (such as a row or a page) at any one time.
 - Read locks are compatible with other read locks.
- Write locks
 - Only one write lock can exist on a resource at any time.
 - Write locks are not compatible with other locks, including read locks.

Isolation level: Read uncommitted

- In this level, dirty reads are allowed so one transaction may see not-yet-committed changes made by other transactions.
- Non-repeatable reads and phantom reads are allowed.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Isolation level: Read committed

- Keeps write locks (acquired on selected data) until the end of the transaction – forbids reading uncommitted data)
- But, read locks are released as soon as the SELECT operation is performed (so the non-repeatable reads phenomenon can occur.)
- Range-locks are not managed.
- No dirty reads
- Non-repeatable reads and phantom reads are allowed.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Isolation level: Repeatable reads

- Keeps read and write locks (acquired on selected data) until the end of the transaction.
- However, range-locks are not managed, so the phantom reads phenomenon can occur.
- No dirty reads, no unrepeatable reads
- Phantom reads are allowed.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Isolation level: Serializable

- Keeps read and write locks (acquired on selected data) until the end of the transaction.
- Also *range-locks* must be acquired when a SELECT query uses a ranged *WHERE* clause, especially to avoid the phantom reads phenomenon.
- No dirty reads, no unrepeatable reads, no phantom reads

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Phantom

'Phantom' is a tuple which did not exist when the first read was made, but appears in the second read because it was created in between the first and the second reads.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Case 1

The update statement of T2 will result in a non-repeatable read, not a phantom. This non-repeatable read can be removed by the isolation level REPEATABLE READ.

T1	Assignment Project Exam Help	T2
select age from users where age > 10 and age < 30;	https://powcoder.com Add WeChat powcoder	update users set age = age * 10 where id = 1; commit;
select age from users where age > 10 and age < 30; commit;		

Case 2

The delete statement of T2 will result in a non-repeatable read if there exists id = 1 and its age is in the range, not a phantom. This non-repeatable read will not happen with the isolation level REPEATABLE READ.

T1

T2

Assignment Project Exam Help

select age from users

where age > 10 and age < 30;

<https://powcoder.com>

Add WeChat powcoder

delete from users
where id = 1;
commit;

select age from users

where age > 10 and age < 30;

commit;

Case 3

T2 will create a phantom (3, 'Bob', 27).

With the READ REPETABLE isolation level, T1 will see this phantom.

With SET TRANSACTION ISOLATION LEVEL SERIALIZABLE; T1 will not see this phantom.

T1 **Assignment Project Exam Help** T2

<https://powcoder.com>

select age from users

where age > 10 and age < 30;

Add WeChat powcoder

insert into users value (3,'Bob', 27);
commit;

select age from users

where age > 10 and age < 30;

commit;

Read Only vs. Read Write

- READ WRITE is a default assumption.

- Exception

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

READ ONLY is the default with ISOLATION LEVEL
READ UNCOMMITTED, and therefore, if your
transaction should be READ WRITE and at the level
of READ UNCOMMITTED, you must explicitly SET
TRANSACTION READ WRITE.

Isolation Levels vs. Read Phenomena

	Dirty Reads	Non-repeatable Reads	Phantom Reads
Read Uncommitted	Allowed	Allowed	Allowed
Read Committed	Not Allowed	Allowed	Allowed
Repeatable Read	Not Allowed	Not Allowed	Allowed
Serializable	Not Allowed	Not Allowed	Not Allowed

MySQL: Transactions

- `START TRANSACTION ; //` disable auto-commit until commit or rollback
- `COMMIT` [Assignment Project Exam Help](#)
- `ROLLBACK` <https://powcoder.com>
- Note:
 - [Add WeChat powcoder](#)
 - `BEGIN` and `BEGIN WORK` are aliases for `START TRANSACTION`.
 - `BEGIN` and `BEGIN...END` are different: The first one is to initiate a transaction and the second one is to form a compound statement.

Transaction and Stored Procedure

```
CREATE TABLE T1(A INT PRIMARY KEY, B INT) ;  
INSERT INTO T1 VALUES (1,2), (3,4);
```

```
Drop procedure if exists CommitTest;
```

```
delimiter //
```

```
create procedure CommitTest()
```

```
begin
```

```
delete from t1 where a = 1;
```

```
end; //
```

```
delimiter ;
```

```
START TRANSACTION;
```

```
delete from t1 where a = 3;
```

```
CALL CommitTest;
```

```
rollback;
```

```
select * from t1; # (1,2), (3,4)
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Transaction and Trigger

```
Drop table if exists t1;
```

```
CREATE TABLE T1(A INT PRIMARY KEY, B INT) ;
```

```
INSERT INTO T1 VALUES (1,2), (3,4);
```

```
Drop table if exists t2;
```

```
CREATE TABLE T2(X INT PRIMARY KEY, Y INT) ;
```

Assignment Project Exam Help

```
drop trigger if exists deleteFromTransaction;
```

```
delimiter //
```

<https://powcoder.com>

```
create trigger deleteFromTransaction
```

```
after delete on T1
```

Add WeChat powcoder

```
for each row
```

```
begin insert into t2 values (Old.A,Old.B);end; //delimiter ;
```

```
START TRANSACTION; delete from t1 where a = 3;
```

```
rollback;
```

```
select * from t1; # (1,2), (3,4)
```

```
select * from t2; # empty
```
